

Planet History

Formation of the Solar System

Around 4.6 billion years ago, the Solar System formed from a cloud of gas and dust.

Accretion of Planetary Bodies

Planetesimals collided and stuck together, forming the early planets.

The Hadean Eon

The Earth was extremely hot with a molten surface and frequent asteroid impacts.

Formation of the Moon

A Mars-sized body collided with Earth, and debris formed the Moon.

The Archean Eon

The Earth's crust cooled and oceans formed; early microbial life appeared.

The Proterozoic Eon

Oxygen started to accumulate in the atmosphere; more complex life forms evolved.

The Phanerozoic Eon

Major diversification of life occurred, including the Cambrian Explosion.

Age of Dinosaurs

Dinosaurs dominated the planet during the Mesozoic era.

Mass Extinction Events

Earth experienced several mass extinctions that reshaped life.

Rise of Mammals and Humans

After the dinosaurs, mammals thrived, eventually leading to the rise of humans.
